to train the model

we are going to train linear regresssion model; we need to split out data into two values varible x and y where x is independent(input) and y is dependent on x (output) we could ignore addrees column as it not require four model

In [14]:

In [15]:

```
# to split my dataset into test and train data
from sklearn.model_selection import train_test_split
x_train,x_test,y_train,y_test = train_test_split(x,y,test_size=0.3)
```

In [16]:

```
from sklearn.linear_model import LinearRegression
lr=LinearRegression()
lr.fit(x_train,y_train)
```

Out[16]:

LinearRegression()

```
In [17]:
```

```
print(lr.intercept_)
```

13525.271371865661

In [18]:

```
coeff=pd.DataFrame(lr.coef_,x.columns,columns=['Co-effecient'])
coeff
```
